IVF Centre in Haridwar

What is In Vitro Fertilization?

In Vitro Fertilization (IVF) is utilized to treat infertility in couples. It involves extracting a lady's eggs, fertilizing the eggs in the research facility with sperm, and after that transferring the resulting embryo(s) into the lady's uterus through the cervix (fetus transfer) where it can create. Most couples transfer two developing lives; in any case, more might be transferred in certain cases. IVF is the most common type of Assisted Reproductive Technology (ART) and it is frequently the treatment of decision for a lady with blocked, seriously harmed, or missing fallopian tubes. IVF is additionally utilized for infertility brought about by endometriosis or male factor infertility. IVF is now

and then used to treat couples with long haul unexplained infertility who have not had the option to consider with other infertility treatments. More than one IVF cycle, be that as it may, is normally required.
